WORKING PAPERS	Expectation Formation from Realized Stock Prices: An Eye-Tracking Study (with Huseyin Gulen) <p>Eye movements reflect biases inherent in decisions. I conduct an eye-tracking experiment to measure how subjects allocate attention over a price chart while they predict future stock returns. I confirm that the attention allocation reflects how subjects form expectations from past price information. The measure of expectation based on eye-tracking quantitatively fits the actual forecasts submitted by subjects. Easily recognizable patterns in data receive disproportionately more attention: Subjects spend much more time reading recent as well as extreme trends and price levels. Such heuristics in information acquisition are heterogeneous across subjects and lead to inferior forecast precision. Overall, the results provide direct evidence for investor beliefs hypothesized by theories of return extrapolation.</p>

Extrapolative Expectations and Investment Decisions: Evidence from Scrip Dividends
(with Sergey Chernenko and Huseyin Gulen)

Using data on scrip dividends, which give shareholders the option to receive additional shares instead of cash dividends, we investigate how investors form expectations of future returns. We find that more shareholders choose to receive dividends in shares when recent past returns are higher, especially when returns are positive and volatile. In addition, extrapolative beliefs among shareholders are stronger in small firms, growth firms, and firms with low institutional ownership. Finally, take-up rates of scrip dividends negatively predict both short-run and long-run future returns. Our findings show that shareholders, like general investors, are affected by extrapolative beliefs when forming expectations of future returns on their holdings.

Shareholder Meetings Matter: Evidence from the Options Market
(with Kateryna V. Holland and Irene Yi)

Media Coverage: [IR magazine](#)

This paper examines the value and timing of information released during shareholder meetings using options. In contrast to studies that report insignificant market reactions around these meetings, we provide evidence that shareholder meetings matter. Our findings indicate that option

prices peak around the record date and decline leading up to the meeting date, suggesting that information on meeting agendas and voting outcomes is not immediately absorbed by the market but is instead aggregated gradually throughout the meeting cycle. The decline in option prices is quantitatively substantial, varies by proposal topic and contentiousness level, and persists even after controlling for voting premiums and borrowing fees. Our results suggest that previous studies may have underestimated the value of shareholder meetings by relying solely on event returns.

WORK IN PROGRESS	Public Firms in Open Source Innovation (with Logan Emery and Shiwei Ye)	
	New Listings and Stock Return Distribution: Evidence from International Markets (with Jaewon Choi and Yeejin Jang)	
	Equity Term Structure and Merger Activity (with Huseyin Gulen)
